

FOR SMART PARKING

A-to-Be Parking™

••••• All information included in this document is subject to change as the product evolves

Parking has evolved a lot in the last decades. From seamlessly opening gantries to fast payments, the process is getting easier and more comfortable.

In conjunction with **A-to-Be LinkBeyond™**, our parking solution uses both radio-frequency and license-plate recognition to identify and clear each car for access control to car parks, as well as for street enforcement.

The client relies on its smartphone for the multiple steps of engaging with parking – planning, execution and feedback. Through an app, he has the ability to indicate its destination and have a range of choices offered – even booking a spot. The very same mobile application enables him to determine the amount of time needed to park the car or to access parking lots gated perimeters, interacting with hardware solutions in place.

Benefits

A single bill for all mobility services, including parking, regardless of the operators used.

Commercial discounts and loyalty programs.

Park operators use the same road-side systems they already have.

Features

-  Ahead planning and booking a parking space
-  Smartphone provides access gated perimeters
-  Remote control of the amount of time needed, for one or more vehicles
-  Service real-time feedback
